HW1CSDS343

1

Let L_1 and L_2 be decidable languages over the same alphabet Σ . Consider language $L=L_1\oplus L_2$ Prove that L is decidable.

⊘ Ans

Assume L_1, L_2 are decidable languages

 $\exists A_1$ that decides L_1

 $\exists A_2$ that decides L_2

Create A_3

 A_3 runs on x:

- Run A_1 on x
- If A₁ accepts:
 - Run A_2 on x
 - If A_2 accepts:
 - Output "no"
 - Else:
 - Output "yes"
- Else:
 - Run A_2 on x
 - If A_2 accepts:
 - Output "yes:
 - Else:
 - Output "no"

Proof

Show A_3 decides L

$$L = L_1 \oplus L_2$$

If $x \in L$ then $(x \in L_1 \land x
otin L_2) \lor (x
otin L_1 \land x \in L_2)$

- ullet If $x\in L_1\wedge x
 otin L_2$
 - A_3 will run A_1 which accepts, then it will run A_2 which rejects. So A_3 accepts.

- If $x \notin L_1 \land x \in L_2$
 - A_3 will run A_1 which rejects, then it will run A_2 which accepts. So A_3 accepts.

If $x \notin L$ then $(x \in L_1 \land x \in L_2) \lor (x \notin L_1 \land x \notin L_2)$

- ullet If $x\in L_1\wedge x\in L_2$
 - A_3 will run A_1 which accepts, then it will run A_2 which accepts. So A_3 rejects.
- If $x \notin L_1 \land x \notin L_2$
 - A_3 will run A_1 which rejects, then it will run A_2 which rejects. So A_3 rejects.

2

Let L be a language over alphabet Σ . Prove that if both L and \bar{L} (the complement of L) are recognizable, then L is decidable.

Ans

Assume L_1, L_2 are recognizable languages

 $\exists A_1$ that recognizes L_1

 $\exists A_2$ that recognizes L_2

Create A_3

 A_3 runs on x:

- For i = 0, 1, 2, ...:
 - Run A_1 on x
 - If A₁ accepts:
 - Ouput "yes"
 - Else:
 - Run A_2 on x
 - If A_2 accepts:
 - Ouput "no"

Show A_3 decides L

If $x \in L$ then A_3 runs A_1 which accepts in a finite number of steps. So A_3 will output "yes" in a finite number of steps.

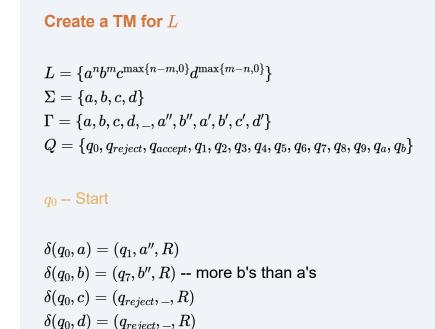

If $x \notin L$ then $x \in \overline{L}$ so A_3 runs A_2 which accepts in a finite number of steps. So A_3 will output "no" in a finite number of steps.

3

// Ans

 $\delta(q_0, \underline{\ }) = (q_{accept}, \underline{\ }, R)$

Let L be the set of all strings over the alphabet $\Sigma=\{a,b,c,d\}$ defined as $L=\{a^nb^mc^{\max\{n-m,0\}}d^{\max\{m-n,0\}}\}$ for n,m non-negative integers. For example, aaabbc and aabbbd are both strings of the language. (This is basically doing the subtraction n-m). Write a Turing machine that will accept all strings that are in L and reject all other strings. Explicitly give your machine's alphabet, set of states, and transition function.

$$\begin{split} &\delta(q_0,a'')=(q_{reject},{}_-,R) \text{ * This should not happen} \\ &\delta(q_0,b'')=(q_{reject},{}_-,R) \text{ * This should not happen} \\ &\delta(q_0,a')=(q_{reject},{}_-,R) \text{ * This should not happen} \\ &\delta(q_0,b')=(q_{reject},{}_-,R) \text{ * This should not happen} \\ &\delta(q_0,c')=(q_{reject},{}_-,R) \text{ * This should not happen} \\ &\delta(q_0,d')=(q_{reject},{}_-,R) \text{ * This should not happen} \end{split}$$
